# SEN'S CAPABILITY APPROACH AND GENDER INEQUALITY: SELECTING RELEVANT CAPABILITIES

Ingrid Robeyns

#### ABSTRACT

This paper investigates how Amartya Sen's capability approach can be applied to conceptualize and assess gender inequality in Western societies. I first argue against the endorsement of a definitive list of capabilities and instead defend a procedural approach to the selection of capabilities by proposing five criteria. This procedural account is then used to generate a list of capabilities for conceptualizing gender inequality in Western societies. A survey of empirical studies shows that women are worse off than men on some dimensions, better off on a few others, and similarly placed on yet others, while for some dimensions the evaluation is unclear. I then outline why, for group inequalities, inequalities in achieved functionings can be taken to reflect inequalities in capabilities, and how an overall evaluation could be arrived at by weighting the different capabilities.

#### KEYWORDS

Amartya Sen, Martha Nussbaum, capability approach, capability lists, gender inequality, well-being

#### INTRODUCTION

Much of Amartya Sen's work has focused on inequality and poverty. In his earlier writings, Sen (1973) criticized the existing literature on inequality measurement in welfare economics for being too concerned with complete rankings of different social states. Sen argued that we should not assume away complexities or ambiguities, and that often we can only make partial comparisons. For example, we might be able to say that person 1 (or country 1) is definitely better off than persons 2 and 3, but we might not be able to rank the well-being of 2 and 3. Sen has also criticized the inequality literature in welfare economics for being exclusively focused on income (Amartya Sen 1985, 1987, 1992, 1993, 1995, 1998). Instead, Sen argues, we should focus on the real freedoms that people have for leading a valuable life, that is, on their capabilities to

Feminist Economics ISSN 1354-5701 print/ISSN 1466-4372 online © 2003 IAFFE https://www.tandf.co.uk/journals DOI: 10.1080/1354570022000078024

undertake activities such as reading, working, or being politically active, or of enjoying positive states of being, such as being healthy or literate. This line of Sen's work, known as the capability approach, postulates that when making normative evaluations, the focus should be on what people are able to be and to do, and not on what they can consume, or on their incomes. The latter are only the means of well-being, whereas evaluations and judgments should focus on those things that matter intrinsically, that is, on a person's capabilities.

It is immediately clear that the capability approach has enormous potential for addressing feminist concerns and questions. Ever since its inception, the women's movement has focused on many issues that are not reducible to financial welfare, such as reproductive health, voting rights, political power, domestic violence, education, and women's social status. In this paper I want to ask how the capability approach can be used to study one core and overarching feminist concern, namely gender inequality. More precisely, I will outline how gender inequality can be conceptualized and assessed from a capability perspective. What precisely do we measure, and how much gender inequality can we observe?

Sen has claimed that "the question of gender inequality ... can be understood much better by comparing those things that intrinsically matter (such as functionings and capabilities), rather than just the means [to achieve them] like ... resources. The issue of gender inequality is ultimately one of disparate freedoms" (Sen 1992: 125). However, Sen's capability approach does not provide a ready-made recipe that we can apply to study gender inequality. It only provides a general framework, and not a fully fleshed-out theory. One of the crucial questions that Sen has not answered is which capabilities are relevant for assessing inequality. In other words, Sen has no proposed a well-defined list of capabilities.

It could be argued that there are already a number of studies that measure gender inequality in capabilities. Indeed, some studies on aggregated or macro gender inequality indices effectively assess inequality in capabilities or capability-like dimensions (Jane Humphries 1993; UNDP 1995; A. Geske Dijkstra and Lucia Hammer 2000). This literature certainly comes close to defining gender-sensitive multidimensional inequality or well-being indices that are in line with Sen's capability approach. Newever, these indices generally compare countries, not individuals. We instead of average levels between countries. This paper is a step in that direction.

# I. A BRIEF DESCRIPTION OF SEN'S CAPABILITY APPROACH

The capability approach advocates that we focus on people's capabilities when making normative evaluations, such as those involved in poverty

### SELECTING RELEVANT CAPABILITIES

might still have the same utility level. Clark examined several possible from doing paid work than men, even after controlling for personal and job utility seems to have a gendered dimension. For example, Andrew Clark situation. This is especially important from a gender perspective because unhealthy and badly sheltered person who has mentally adapted to her a happy, healthy, well-sheltered person, and an equally happy, but evaluation will only assess her satisfaction and will not differentiate between still be contented with life if she has never known differently. A utilitarian intertemporal comparisons. A person may be in a desperate situation and hide important dimensions and lead to misleading interpersonal or exclusively on utilities, resources, or income. He argues against a utilityshould look at people's capabilities, Sen criticizes evaluations that focus our motivations for valuing specific lifestyles, and not simply value a certain stresses the importance of "reason to value" because we need to scrutinize overall freedom to lead the life that a person has reason to value. Sen outcome and an opportunity. All capabilities together correspond to the achievement and the freedom to achieve something, or between an functioning and a capability is similar to the difference between an market, caring for others, and being healthy. The difference between a community, being sheltered, relating to other people, working on the labor are beings and doings. Examples are being well fed, taking part in the capabilities? Capabilities are people's potential functionings. Functionings issues, development ethics, and inequality analysis. What are these measurement, cost-benefit analysis, efficiency evaluations, social justice higher job-related utilities were caused by their lower expectations. characteristics. Women who are worse off than men in objective terms (1997) has shown that British women have a higher job satisfaction or utility based evaluation of individual well-being because such an evaluation might life without reflecting upon it. By advocating that normative evaluations explanations for this gender differential and concluded that women's

The capability approach also rejects normative evaluations based exclusively on commodities, income, or material resources. Resources are only the *means* to enhance people's well-being and advantage, whereas the concern should be with what matters intrinsically, namely people's functionings and capabilities. Resource-based theories do not acknowledge that people differ in their abilities to convert these resources into capabilities, due to personal, social or environmental factors, such as physical and mental handicaps, talents, traditions, social norms and customs, legal rules, a country's public infrastructure, public goods, climate, and so on. In traditional welfare economics, income (and sometimes expenditure) is the most widely used variable, and there is little discussion on whether other variables should be used (Frank Cowell 1995; Alisa Goodman, Paul Johnson, and Steven Webb 1997; D. G. Champernowne and Frank Cowell 1998). Economic historians have long looked at

other dimensions, such as height, mortality, and political freedoms. Welfare economists who measure individual well-being have also begun to pay more economists who measure individual well-being have also begun to pay more attention to other indicators, but income remains the dominant focus, attention to other indicators, but income remains the dominant focus.

the policies that can rectify them. investigating the corresponding resources that cause these inequalities, or way of affecting the distribution of capability well-being. This paper has the ing in the distribution of resources will be a crucial (although not the only) assessing which policies can reduce gender inequalities, because intervenshould not only map the gender inequalities in functionings and more limited aim of assessing gender inequality in capabilities, without inequalities in capabilities and functionings. This is especially important for capabilities, but also analyze which inequalities in resources cause gender status, and empowerment." A complete analysis of gender inequality most critical contributor to the gender gap in economic well-being, social that "the gender gap in the ownership and control of property is the single need to be studied. For example, Bina Agarwal (1994: 1455) has argued can be significant causes of inequalities in capabilities and therefore also resources can make to people's well-being. Indeed, inequalities in resources The focus on capabilities does not deny the important contribution that

of theories (e.g., most strands of liberal theories) that are compatible with the capability approach. libertarian or communitarian theories), but there will still remain a range theories of human nature and society would be excluded (e.g., strong particular world-view. If we interpret all of Sen's work as being one nature and society, and Sen's capability approach does not defend one integrated body of thought, as Sabina Alkire (2002: 87) does, then many frameworks always depend on explanatory or ontological views of human important each will be in an overall judgment. In addition, normative approach implies that we choose the relevant capabilities and indicate how should be aggregated in an overall assessment. Applying the capability capabilities should be taken into account, or how different capabilities space should be that of capabilities. However, it does not stipulate which The capability approach, strictly speaking, only advocates that the evaluative how to measure inequality or poverty, nor is it a complete theory of justice. our normative questions. It is not a mathematical algorithm that prescribes tool, but it is not a fully specified theory that gives us complete answers to all character. The capability approach is a framework of thought, a normative One important aspect of Sen's capability approach is its underspecified

## II. SOME STRENGTHS AND WEAKNESSES OF THE CAPABILITY APPROACH

Why make normative assessments in the space of capabilities, and why would this framework be attractive for an analysis of gender inequality? In

### SELECTING RELEVANT CAPABILITIES

this section, I will discuss three strengths and one weakness of the capability approach for normative assessments in general and for gender inequality analysis in particular.

denying the impact of care, social relations, and interdependence between individualism rejects the idea that women's well-being can be subsumed is a desirable characteristic for well-being and inequality analysis (Ingrid social norms and discriminatory practices. In sum, the ethically individuaalso allow us to take into account a number of societal features, such as of the actions of others. The social and environmental conversion factors communities. At the same time, the capability approach is not ontologically units of normative judgment are individuals, and not households or account in our normative judgments. Ethical individualism implies that the family or community members. under wider entities such as the household or the community, while not Robeyns 2001b). This is also attractive for feminist research, because ethical listic and ontologically nonindividualistic nature of the capability approach functionings and capabilities are independent of our concern for others or individualistic. It does not assume atomistic individuals, nor that our individualistic theory. This means that each person will be taken into individuals. Hence the capability approach is an ethically (or normatively) The first advantage is that functionings and capabilities are properties of

this money herself, or obtained it from her partner. Conceptualizing and it does not matter in a well-being assessment whether a person has earned household income were shared completely, it is problematic to assume that significantly affect inequality and poverty measurement. And even if that assumptions about the degree of sharing within the household Woolley and Marshall (1994) and Phipps and Burton (1995) have shown 1995; Shelly Lundberg, Robert Pollak, and Terence Wales 1997). Moreover, household income equally (Jan Pahl 1989; Shelley Phipps and Peter Burton assumption turns out to be unrealistic, as not all partners share the total that there is no inequality within the household." But this standard have argued: "standard approaches to inequality measurement presume welfare economics.2 As Frances Woolley and Judith Marshall (1994: 420) literature has had little significant impact on inequality measurement in now a substantial literature on intra-household allocations, but this their incomes, or that they receive equal shares of the benefits. There is by families are often sloppily equated as in assumptions that partners pool individualistic, but this principle gets lost in applied work. Individuals and ignore intra-household inequalities (Susan Okin 1989; Diemut Bubeck about gender relations within the family which are unrealistic and deny or well-being approaches in welfare economics or political philosophy. In the 1995). In welfare economics generally, inequality theories are ethically latter, accounts of inequality and well-being often use implicit assumptions The capability approach is therefore a major improvement over standard

measuring gender inequality in functionings and capabilities helps avoid these problems, since it focuses on the lives that individuals can and do choose to live, and not on their average household income.

related assessments of well-being and disadvantage. outside the market than men. These aspects matter particularly in gender networks. They also miss the fact that women spend much more time freedom from domestic violence, or the availability of supportive social important aspects of well-being such as care labor, household work comparisons of income, carnings, and job-holdings, exclude some 2000). Inequality comparisons based only on the market economy, such as nonmarket economy (e.g., Nancy Folbre 1994, 2001; Susan Himmelweit attention to processes and outcomes in both the market economy and the Feminist economists have long been arguing that economics needs to pay capture. This is especially important for gender inequality research, distribution of well-being that an analysis of income or wealth alone cannot in our normative analysis will reveal complexities and ambiguities in the nonmarket settings. The inclusion of nonmarket dimensions of well-being the market, but looks at people's beings and doings in both market and The second advantage of the capability approach is that it is not limited to

The third strength of the capability approach is that it explicitly acknowledges human diversity, such as race, age, ethnicity, gender, sexuality, and geographical location as well as whether people are handicapped, pregnant, or have caring responsibilities. Sen has criticized inequality approaches that assume that all people have the same utility functions or are influenced in the same way and to the same extent by the same personal, social, and environmental characteristics:

Investigations of equality—theoretical as well as practical—that proceed with the assumption of antecedent uniformity ... thus miss out on a major aspect of the problem. Human diversity is not a secondary complication (to be ignored or to be introduced "later on"); it is a fundamental aspect of our interest in equality.

(Sen 1992: xi)

Again, this characteristic of the capability approach is important for gender inequality analysis. Sen's concern with human diversity contrasts strikingly with the tendency in standard welfare economics to neglect intra-house-hold inequalities in nonmarket labor and total work loads. Equality is ultimately measured in "male terms" with an exclusive focus on the market dimensions. Feminist scholars have argued that many theories of justice claim to address the lives of men and women, but closer scrutiny reveals that men's lives form the standard and gender inequalities and injustices are assumed away or remain hidden, and are thereby indirectly justified. For example, many theories of justice simply assume that families are just social institutions where love, justice, and solidarity are the rule. This assumption

renders these theories inadequate in their very design for understanding or analyzing intra-household inequalities. Susan Okin (1989: 10–13) has called this "false gender neutrality." As these theories use gender-neutral language, we might be tempted to see them as including the concerns of both men and women. But they ignore the biological differences between the sexes, and the impact that gender has on our lives through gendered social institutions, gender roles, power differences, and ideologies: "Thus gender-neutral terms frequently obscure the fact that so much of the real experiences of 'persons,' so long as they live in gender-structured societies, does in fact depend on what sex they are" (Okin 1989: 11). By conceptualizing gender inequality in the space of functionings and capabilities, there is more scope to account for human diversity, including the diversity stemming from people's gender.

ness, or the importance of care and interpersonal interdependencies, or approach is vulnerable to androcentric interpretations and applications. In in the market can reduce a person's capability set. Or mechanisms that sexist, ageist, Eurocentric, or biased in any other way, the capability every evaluative assessment, implicitly or explicitly, endorses additional the gendered nature of society. that I endorse is one that does not assume away people's interconnectedgender inequality. This implies that the view of social and human nature the remainder of this paper, I present a feminist capability perspective on capabilities.3 Thus, a major concern for feminists is that the capability then she will come to different conclusions about gender inequality in preference formation, or claims that they have no normative significance If someone denies the existence of gender discrimination and gendered the different choices that women and men make from their capability sets. form gendered preferences, such as socialization, can have an impact on evaluation will be accordingly affected. For example, gender discrimination the capability framework. If the social theories are racist, homophobic, divergent normative results, depending on which social theories we add to social theories, including accounts of the individual, social, and environwhen making inequality assessments we should focus on capabilities. But character. Capability egalitarianism, strictly speaking, only advocates that also has one major drawback, which stems from its underspecified mental conversion factors, and a normative theory of choice. We get quite However, these positive features notwithstanding, the capability approach

However, viewing social and human nature from a feminist perspective is not sufficient for applying the capability approach to gender inequality. Because of its underspecified nature, Sen's capability approach needs at least three additional specifications before we can apply it. First, we have to select which capabilities are important for evaluating gender inequality and should therefore be included in a list of relevant capabilities. Second, we have to take a stand on whether to look at gender inequality in functionings

SELECTING RELEVANT CAPABILITIES

or in capabilities. Third, to make an overall evaluation, we need to decide how to weight the different functionings or capabilities. In this paper I am concerned mainly with the selection of capabilities, and will discuss the other two issues only briefly.

## III. THE NEED FOR A DEFINITE LIST

Martha Nussbaum (1988: 176; 2003) has argued that Sen should endorse one definite list of valuable capabilities, if he wants to apply the capability approach to social justice and gender inequality. Nussbaum (1995, 2000, 2003) has herself drawn up such a list of capabilities that she defends as universally valid. Although she concedes that her list would need further elaboration and adaptation by context, she argues that such a specification is an essential first step.

I disagree with Nussbaum's claim that Sen should endorse one alginite list of capabilities. It is crucial to note that Nussbaum's and Sen's versions of the capability approach have different theoretical assertions, and their approaches entail different conceptions of what the list should be doing. As Sabina Alkire (2002; 54) notes: Nussbaum's list is "a list of normative things-to-do"; it has a highly prescriptive character and she makes strong universalistic claims regarding its scope. Nussbaum has also used the capability approach to develop a universal theory of the good: it applies to all social justice issues, and to the world as a whole. This does not imply, she argues, that her list is insensitive to culture and context. It is formulated at a highly abstract level, and for each country or community it can then be made more specific. Hence, in Nussbaum's theory, there is one universal general list that can be translated into more detailed and specific lists to suit the context (Nussbaum 2000).

Sen's capability approach, by contrast, makes broader and less specified claims. Given the intrinsic underspecification of Sen's capability approach, there cannot be one catch-all list. Instead, each application of the capability approach will require its own list. For Sen, a list of capabilities must be context dependent, where the context is both the geographical area to which it applies, and the sort of evaluation that is to be done. Applications of Sen's capability approach can be very diverse. They can be academic, activist, or policy-oriented. They can be abstract and philosophical, or applied and down-to-earth. They can be theoretical or empirical. They can concern social, political, economic, legal, psychological, or other dimensions of advantage, taken together or individually or in any combination. They can be specified for the global or the local context. And so forth.

The differences in Sen's and Nussbaum's capability approaches, and their different views on the desirability of one definite list can be better understood by keeping in mind their respective academic fields and expertise. Sen's roots lie in the field of social choice, and he therefore

believes that we should search for fair and consistent democratic procedures to draw up the list. Nussbaum, on the other hand, has done a lot of work on the philosophy of the good life and, more recently, on constitutional design, and in this context it is much more important that a scholar proposes and defends a fully-fleshed out list of capabilities. As Fabienne Peter (2003) concludes from her analysis of the relevance of Sen's contribution to social choice theory for gender issues, "taking people seriously as agents entails giving them a chance to be heard, and to be involved in collective evaluations and decisions." For a collective evaluation or for making a decision from a capability perspective, this certainly includes being heard and being involved in the selection of capabilities.

Suppose now that we apply Sen's capability approach to a particular question, and we end up with exactly the same list as Nussbaum's. Would this then confirm that Nussbaum is correct in defending one particular list? I think not. First, even if the actual list drawn up by someone using Sen's capability approach is the same as Nussbaum's, the underlying assumptions of what this list is, and what it is supposed to da, remain different. The theoretical status of the lists will remain distinct, even if both lists contain exactly the same elements.

proposing the same dimensions, might lack academic legitimacy. existing literature in that field. In this sense, Nussbaum's list, even when to particular research questions concerning gender inequality, we might needed for policy design. Similarly, when the capability approach is applied which Nussbaum's list is generated might lack the political legitimacy capability approach leads us to a list identical to Nussbaum's, the process by Nussbaum's list will lack. In other words, even if the application of Sen's of priorities. This will give a legitimacy to the outcome that simply copying or the village council go through a democratic process for drawing up a list comprehensive outcome, it would still be important that the social scientist and they end up using Nussbaum's list of capabilities. In terms of the capability approach to decide on priorities for the allocation of its funds, approach to gender inequality assessment, or a village council uses the (Amartya Sen 1997). Suppose that a social scientist applies the capability aspects of the choice process, including the identity of the chooser on the list), but also with the comprehensive outcome, which includes with culmination outcomes (the outcome narrowly defined, here the items emphasized that in matters of social choice and distributive justice, prefer lists that are derived from, embedded in, and engage with the processes matter a great deal. Indeed, we should be concerned not only list's political or academic legitimacy. Amartya Sen has repeatedly Second, the process that generates a list is important and this could affect a

Summing up, if we want to respect Sen's capability approach as a general framework for normative assessments, then we cannot endorse one definite list of capabilities without narrowing the capability approach.<sup>5</sup> Note that

without violating the basic tenets of Sen's approach? capabilities. I now turn to the question: how can this selection be made specified purposes, be they theoretical or empirical, we must select this does not contradict the claim that to use Sen's capability framework for

# IV. FIVE CRITERIA FOR THE SELECTION OF CAPABILITIES

will need a relevant list of functionings and capabilities. How should this that its further specifications can be diverse. For each such specification, we list of functionings, I suggest that the following five criteria should be met selection be made, and what type of list is appropriate? Large skills. In half of the countries males did better in mathematics (OECD 2001) OECD countries found that girls consistently outperformed boys in reading achievement of boys in schools. However, this alleged underachievement is expectations that are making it more difficult for girls and women to pursue not unambiguously supported by evidence. A recent study of 15-year-olds in Instead, most public attention has been paid to the apparent underadvanced studies or studies in areas that are perceived as men's domain schools, colleges, and universities, or to the gendered social norms and In recent years, less attention has been paid to the gendered character of

7. Domestic work and nonmarket care. This capability involves raising children and taking care of other dependents, especially the elderly, and it is highly gendered; women do more nonmarket care for children as well as for the frail, the elderly, and the sick. But the largest inequality is in household work.

Is domestic work and nonmarket care an important capability? Obviously these activities are crucially important for the receivers; they affect their functionings of life and health, education and knowledge, bodily integrity and safety, social relations, and leisure activities. Thus, analyzing the supply of labor for domestic work and nonmarket care through a capability lens supports the claim that they are extremely important (Folbre 1994, 2001; Himmelweit 2000).

But how do nonmarket care and domestic work affect the caregiver? The answer will be mixed: some aspects of this capability will be valuable, others less so, and still others plainly negative. Some of these functionings will be valuable and enjoyable if done out of choice and for short periods, but could become burdensome and monotonous if they are mandatory and have to be done for extended periods. For example, cooking a meal once a week on a relaxing Sunday is a different experience from cooking meals five days a week, under time pressure, and after a full working day. The same can be said of caring for the ill, the elderly, or children—it becomes a different experience if undertaken every day rather than occasionally.

This capability, together with the capability to undertake paid work, do pose interpretation difficulties because they cannot unambiguously be seen as contributing to the well-being of the worker. This will be discussed below.

### SELECTING RELEVANT CAPABILITIES

8. Paid work and other projects: This functioning is again highly gendered and mirrors to a large extent the gender inequality in domestic work and nonmarket care. On average, women are less active in the labor market than men and do worse jobs. To investigate this gender inequality we have to look at labor market participation, employment rates, unemployment rates, annual hours of work, and working conditions—all aspects that have been studied extensively (e.g., Francine Blau 1998; Jill Rubery, Mark Smith, and Colette Fagan 1999). Also, given that the capability approach should not be restricted to the market economy, we also need to include projects that do not necessarily involve paid work, like artistic creations or the organizing of a social or community event. For example, it should not be made more difficult for a female than a male artist to display her paintings or sculptures in an art gallery.

although we would probably first think of shelter and environment as environment can be conceptualized as functionings and capabilities. 9. Sheller and environment. Being sheltered and enjoying a safe and pleasant neighborhoods provide facilities for childcare or spaces for children to play shelter, we have to investigate aspects such as the extent to which men and significant gender inequality (Sara Lelli 2001; Robeyns 2002), although empirical studies of housing and neighborhood conditions do not find a ment be a relevant dimension of gender inequality? Most quantitative thereby has a substantial impact about how one feels about oneself and instrumental level, good housing is positively related to good mental and Bratt (2002) argues that housing is important for people's well-being. At the needed for conceptualizing them as functionings and capabilities. Rachel resources. Both conceptualizations are possible, but more theorizing decision-making power over constructing or furnishing a house, or whether women have equal access to space within the house they share, or equal live in slightly better housing than men. To fully assess gender inequality in Enrica Chiappero Martinetti (2000) finds for Italy that on average women even about one's personal empowerment. How can shelter and environthat is most intimately associated with one's identity" (Bratt 2002: 19), and physical health. But housing also counts intrinsically as "the physical space in, and so on.

10. Mobility: Relative to other capabilities, being mobile is an instrumental capability. But it can also be valuable in itself, since it enables movement between geographical locations. There are indications that this capability has a gendered dimension. For example, public transport does not always accommodate the needs of people caring for small infants. Many railway stations and train carriages are not designed to accommodate parents (often mothers) traveling with pushchairs. If women are disproportionately responsible for infants (which is the case), or if women have to rely more on

public transport than men, or if they are more responsible for caring for the old and the sick who might be in wheelchairs, then this creates a gender inequality in mobility. Also, in many old European cities sidewalks are sometimes too narrow for a pushchair, making it more difficult for parents of infants to be mobile than for people without small children, again resulting in a gender inequality since typically women are responsible for infants. These direct constraints on women's mobility are in addition to the constraints created by their responsibility for the care of children, the aged and the ill–a responsibility that tends to keep them more confined to the home than men.

11. Leisure activities. Material affluence gives people the opportunity to enjoy leisure activities, such as watching TV, reading, walking, doing physical exercise, playing games, practicing the arts, and so on. These activities are an important means of relaxation, creativity, and pleasure; hence, they are intrinsic aspects of well-being.

Based on 1999 time budget data for Flanders, Ignace Glorieux, Suzanna Koelet and Maarten Moens (2001) find that on a weekly basis men spend 6 hours and 46 minutes longer on leisure activities than women. However, time-inequalities do not tell us the full story. Based on an international comparison, Michael Bittman and Judy Wajeman (2000) argue that on average men and women tend to have similar quantities of free time, but there is a gender gap in how leisure is experienced and enjoyed. On the basis of Australian data, Bittman and Wajeman (2000: 181 – 3) argue that on average men enjoy higher quality leisure than women do because men's leisure is less interrupted by work, or combined with unpaid work or childcare.

12. Time-autonomy: The list of capabilities proposed in this paper includes the three main activities on which people spend their time (market work and projects, domestic work and nonmarket care, and leisure activities). But it is still argued that the core of gender inequality is the gender division of labor, in other words the gender division of time and responsibilities for market work, nonmarket work, and leisure. The allocation of time within the household is usually a collective and not an individual decision and is influenced by many individual, household, and community characteristics (Bubeck 1995; Agarwal 1997; Ingrid Robeyns 2001a). Feminist scholars have argued repeatedly that the current gender division of labor is unjust and generally to women's disadvantage.

Another aspect of the quality of time spent on an activity is the way people experience that activity. Shelley Phipps, Peter Burton, and Lars Osberg (2001) have shown that women in dual-career households face more time pressure than their husbands. Even if their total work hours (paid and unpaid) are equal, the fact that women are more often responsible for

### SELECTING RELEVANT CAPABILITIES

domestic work that cannot be postponed generates more stress for them. The authors also argue that women's time stress tends to increase because they have to cope with different sets of responsibilities and are subject to social norms that lay more responsibilities on them for the way the household is run or family members are publicly presented.

A full assessment of gender inequalities in time autonomy would also have to investigate whether women and men have the same freedom to go where they please, when they please; whether they are subject to the same social restrictions and expectations; and so on. For example, women are often expected to spend more time keeping their elder parents company than their male relatives. Or they are expected to be on a constant stand-by in case a relative needs help or falls ill, or to take care of their grandchildren.

13. Being respected and treated with dignity: Another capability that warrants inclusion in our list is being respected and treated with dignity. Some feminists have argued that the root of our gendered society is the fact that women are systematically devalued and not considered fully human. Some radical feminists, for instance, give the example of pornography, prostitution, or other acts that treat women as sexual objects (Catharine MacKinnon 1982). Gender differences in the respect accorded to women and men can also be deduced from the limited individual and public recognition that care and domestic work receives. For example, in some European countries, fathers who took paternity leave have reported that they underestimated the importance and pressures of domestic work, and that due to their paternity leave they now have much more respect for this work (Vincent Duindam 1999). However, fathers who take substantial paternity leave are still few. People who do domestic work still receive little respect for their work, in part because such work is culturally perceived as "feminine."

14. Religion: Men and women should have the same freedom to practice or not to practice a religion. In addition, men and women should have the same freedom to debate and determine how their religion develops and to shape religious practices. But several religions reserve the right to interpret the holy books and to make religious statements only for men. Also in several religions women cannot become religious leaders, such as Catholic priests or Muslim Imams. Androcentric or misogynist rules are often imposed on women because they are so interpreted by male religious leaders, even if such rules are not an intrinsic part of the religion. Rather they are cultural practices that have become closely intertwined with religion over time. And while it is generally difficult for both men and women to leave a religious community into which they were born, the costs of women-unfriendly religious practices or of rigid religious identities are usually higher for women.

SELECTING RELEVANT CAPABILITIES

secularized. Many people in Western societies do not actively practice an growing scholarly and public debate on the unequal gender implications of most religions, including Christianity, Judaism, and Islam, all of which are virtually all Western societies include some conservative-orthodox groups of this capability in Western societies, as these societies have become widely judged to contain some women-unfriendly practices. There is, in fact, a religious groups also exist in the West, and their share is increasing. Today, the West) that have become more women-friendly over time. ## VII. CAPABILITIES OR ACHIEVED FUNCTIONINGS?

section gives us a reliable picture of the nature and size of gender inequality in capabilities: inequalities in achieved functionings. What does this tell us about gender Let us now suppose that the empirical evidence discussed in the previous

and gender inequality is not an issue of ethical concern. women have the same legal rights as men, their capability sets are thus equal aim at equality of outcomes, but should respect women's choices. As long as different. For instance, it could be argued that women would have a stronger preference for children than men (Victor Fuchs 1988). Hence, we should not favorable outcomes in some dimensions because their preferences are are equal before the law, and thus have equal opportunities. Women have less One possible answer would be that in Western societies, men and women

choose different functionings from the same capability set. This is application of Anne Phillips's (1999, 2003) more general claim that for if one can give a plausible reason why one group would systematically inequality in achieved functionings implies inequality in capabilities, except inequalities (such as those based on race, caste, gender, or nationality) no means obvious. An alternative position would be that for group I dispute this position, which is based on implicit assumptions that are by

> group inequalities, equality of opportunities and equality of outcomes under good conditions are fewer than for men. that this is what they would choose if they had the same capabilities as men, observation that given existing social conditions women are more likely prefer different options than men, if they had the same real opportunities. The of proof should fall on those who claim that women would systematically likely to find a man as a woman with a given set of preferences. The burden distribution of preferences between groups is identical, that is, we are as the first place. Underlying this reasoning is the assumption that the men and women, we deduce that they did not have equal opportunities in converge. In other words, if we observe inequalities in outcomes between precisely because the real opportunities for women to have a good job than men to choose domestic and care labor over paid work does not mean

new evidence or compelling arguments. little direct information about people's capability levels, we could start by of capabilities, and not in achieved functionings. But given that we have ities in capabilities. This could later be refined and adapted in the face of taking group inequality in achieved functionings as indicative of inequal-Ultimately, we are interested in evaluating group inequalities in the space

attributed to different preferences. No woman wants to be depressed, and gender inequalities in some of these dimensions cannot plausibly be these achieved functionings as intrinsically desirable. The fact that there are would be little dispute over the claim that most people would consider integrity and safety, shelter and environment, and respect. I think there capabilities. Type I would include physical and mental health, bodily no man wants to be attacked on the street. It might be helpful to make a distinction between three types of

on what the optimal level of achieved functioning is, due to their different activities, time-autonomy, and religion. Here people are likely to disagree to gender inequalities in capabilities. differences. Gender inequalities in these achieved functionings thus point be group-based inequalities in achieved functionings that are due to innate educational functioning. But there is no reason to expect that there would educational capability we would expect to see inequalities in achieved late 20s or early 30s to earn a PhD degree. Hence, if there is full equality in life plans. For example, not everybody wants to study until they are in their Type 2 would include education and knowledge, mobility, leisure

relations, political empowerment, domestic work and nonmarket care, and of women's and men's social position are not justified. For example concern. At most we could argue that the corresponding material rewards intrinsically different choices, then these inequalities are not of ethical runctionings are explained by men's and women's different natures, and paid work. If we believe that these different outcomes in terms of The difficulty lies in the third type of capabilities, which encompass social

But as long as there is no consensus, we have to conclude, in consensus over whether gendered choices are due to nature or to social main ethical concern would be to abolish gender as we know it. There is no be that the gender inequalities in achieved functionings are unjust, and the constructed and imposed on men and women, then the conclusion would raditional domestic roles, which is what they ultimately want (James against women because they are not sufficiently supported in their rewarded. According to this view, the fact that men and women are living housewives should be financially protected and care labor should be better Robeyns 2001a). Thus, the burden of proof falls on those who claim that the constraints on choices are structured along gender lines (Folbre 1994 do know that at the moment our choices are constrained unequally because liberated from their gender roles and thus genuinely free to choose. But we mold us. We do not know what men and women would choose if they were line with John Stuart Mill (1869), Bubeck (1995) and Phillips (2003), that Tooley 2002). In contrast, if we hold that gender differences are socially Indeed, some have even argued that today an injustice is done

## VIII. WEIGHTS, AGGREGATIONS, AND OVERALL JUDGMENTS

How, if at all, should we weight the different capabilities in order to aggregate them into an overall evaluation? Obviously, we gain most insights into the nature and size of gender inequality if we look at inequalities in capabilities at the more disaggregated level. But one cannot conclude that women in general are worse off than men, or vice versa, without aggregating the functionings. In addition, for policy decisions and overall judgments, we need to decide whether all capabilities are equally important or whether we should give them different weights.

Can we draw a tentative and provisional conclusion on the nature and size of gender inequality in achieved functionings and thus, in capabilities? On gender differences in achieved functionings, the evidence on social interaction is inadequate to arrive at a firm conclusion. For life expectancy, housing, and bodily integrity, similarly, there is no strong evidence of gender inequality. For domestic and care work, and paid work, the evaluation is disputed, since both types of work can be either a burden or a pleasure. But for mental health, political empowerment, education and knowledge (except for language skills), leisure, time-autonomy, mobility, respect, and religion, the arguments and studies discussed above suggest that women's well-being is less than men's. This means that we can only conclude that women are equally well off or better off than men if we attach

### SELECTING RELEVANT CAPABILITIES

domestic and care work than we attach to all other functionings. Some people might value these functionings strongly, and therefore might not judge women's well-being to be worse than men's. But most people are is quite likely to value domestic work and care as indisputably positive. Indeed, it is quite likely that most people would weight all other functionings taken together as more important than those in which women excel. In other words, my overall judgment would be that women in Western societies are worse off than men, since taken together the dimensions in which women are worse off are more important than those in which men lose out. Ultimately, making an overall judgment implies making a normative choice regarding the weights that should be assigned to different capabilities.

#### IX. CONCLUSION

In this paper I have investigated how we can use the capability approach to study gender inequality. After arguing against the view that Sen's capability approach needs one definite list of capabilities, I proposed a methodology to select relevant capabilities. This methodology was applied to generate a list of capabilities for the study of gender inequality in Western societies and consisted of four steps. The first step was unconstrained brainstorming. The second was an engagement with the existing socio-economic literature and debates on gender inequality. Third, the generated list was compared with other lists. Fourth and finally, the list was debated at seminars and conferences, in informal discussions, and in feminist activist networks. In addition I took account of arguments in anti-feminist literature. To illustrate gender inequality in these dimensions, some empirical findings were discussed. Comments on the list and on the empirical findings led to subsequent revisions—a process which is likely to continue into the future.

I also argued that when looking at group inequalities, the default position should be that group inequalities in achieved functionings mirror inequalities in capabilities, unless there is a plausible reason to expect one group to systematically choose different functionings from its capability set relative to another group. Finally, I offered a tentative answer to the question whether in overall terms one can say that on average men are more advantaged than women. As noted, ultimately the answer depends on the weights that one attaches to the different functionings.

It is obvious that this is not a completed research project. There is much work to be done on furthering the capability approach to gender inequality analysis. On the empirical side we need carefully collected micro-data on all these capabilities. On the theoretical side, we need to further our understanding of the gendered nature of preference formation and the constraints on choice. Once we have a deeper analytical understanding of these phenomena, we can ask how we should deal with them in a normative

normative conclusions. nonfeminist political philosophers and welfare economists tend to deny or framework. Progress on this front is especially important since many ignore the gendered dimension of capabilities, which affects their
